Inngangur

Þekking á snjódýpt á upptakasvæðum snjóflóða er nauðsynleg forsenda fyrir hönnun stoðvirkja. Jafnframt því sem hún er mikilvæg fyrir mat á snjóflóðahættu, bæði í tengslum við aðvaranir og einnig fyrir formlegt hættumat. Árið 1996 hófust reglulegar snjódýptarmælingar á upptakasvæðum á eftirfarandi stöðum (umdæmisstjóri og mælingamenn eru nefndir í sviga):

Flateyri (Oddur Pétursson)

Bolungarvík (Jóhann Hannibalsson, Oddur Pétursson)

Ísafirði (Oddur Pétursson)

Súðavík (Oddur Pétursson)

Siglufirði (Örlygur Kristinnsson)

Seyðisfirði (Hallgrímur Jónsson)

Í mars 1998 var "Snjódýptarmælingar á stikum veturinn 1996/1997" (VÍ-G989118-ÚR14) gefin út. Fram að 1996 höfðu ekki verið gerðar reglulegar mælingar að neinu marki, en á nokkrum stöðum höfðu þó verið framkvæmdar mælingar að einhverju leyti. Snjódýpt í fjallinu ofan Neskaupstaðar hefur verið mæld reglulega með stikum síðan veturinn 1993/94 (Guðmundur Helgi Sigfússon). Mælingunum á Neskaupstað er lýst í greinargerðinni "Snow depth measurements in the mountain above Neskaupstaður" (VÍ-G97015-ÚR11) fram til vetursins 1996/1997. Á Patreksfirði og Bíldudal hefur snjódýpt einnig verið mæld með stikum ofan byggðarinnar en aflestrar hafa ekki verið skráðir með reglubundnum hætti. Í þessari greinargerð eru teknar saman mælingar vetrarins 1997/98 á öllum mælingarstöðum landsins. Lítið var af snjó veturinn 1997-1998 og voru engar snjódýptarmælingar gerðar á Bíldudal, Patreksfirði og Eskifirði.

Stikukerfið veturinn 1997/98

Í eftirfarandi töflu eru upplýsingar um nafn, hæð (í cm) og halla fjallshlíðar (í gráðum) á þeim stöðum þar sem stikurnar standa. Heiti hverjar stiku er byggt á staðarnafni (t.d. "flsk" fyrir "Skollahvilft í Flateyri") og númeri, þar sem fleiri stikur eru oftast á hverjum stað. Nánari staðsetningu er að finna á kortum í vörslu Jóns Gunnars Egilssonar.

Lengd hverrar stiku er mismunandi eftir staðsetningu og eru þær lengri þar sem búist er við mikilli snjódýpt. Hæð stika er yfirleitt á milli 3 og 4,5 m (sjá töflu).

Staðsetning þeirra snjódýptarstika, sem óstaðréttar voru veturinn 1996/97 var mæld sumarið 1998 og eru nánast allar nú staðsettar í hnitakerfinu ÍSN93 og hæð þeirra yfir sjó þekkt.

Nokkrar stikur hafa tapast bæði í snjóflóðum og vegna annarra orsaka á meðan mælingar stóðu yfir.

Mælingar

Snjódýpt við hverja stiku var mæld af athugunarmanni á staðnum með sjónauka. Talinn var fjöldi 30 cm bila upp úr snjó á hverri stiku og lóðrétt snjódýpt fundin með því að draga hæð stikunnar, sem stendur upp úr snjónum, frá heildarlengd stikunnar. Snjódýptin var skráð á skráningarblöð sem send voru til Veðurstofunnar.

Niðurstöður

Gögn um snjódýpt fyrir veturinn 1997/98 eru tekin saman í viðauka I og sýnd á meðfylgjandi línuritum. Í töflunum og línuritunum er lóðrétt snjódýpt við stikurnar gefin í cm. Ef ekki hefur tekist að mæla snjódýpt (t.d. vegna þoku eða eftir að stika er fallin) eru stafirnir "NA" ("not available") skráðir í töfluna. Á nokkrum stöðum er áætluð snjódýpt gefin upp fyrir aftan "NA" í töflunum. Ágiskuð snjódýptargildi eru auðkennd með hring á teikningunum. Snjódýpi við stikur, sem eru á kafi í snjó, er skráð með "Inf" í töfluna og með ör sem bendir upp á línuritunum.

Viðauki I: Snjódýptarmælingar veturinn 1997/98
